[Substitute Specification:]

[- -] LED ARRANGEMENT

[BACKGROUND OF THE INVENTION]

Field of the Invention:]

5 **The present] {The-}** invention is directed to ~~{an LED arrangement according to the preamble of patent claim 1 that, in particular,}~~ **[LED (light emitting diode) arrangements. In particular, the present invention is directed to LED arrangements that]**can be built into a lamp housing ~~{as can be employed, for example,}~~ **[or located]** in exterior lights of motor
10 vehicles.

[Brief Discussion of the Related Art:]

 In the field of exterior and interior illumination of motor vehicles, light-emitting diodes (LEDs) are being increasingly used instead of conventional incandescent bulbs, particularly for tail lights and brake lights,
15 since LEDs have a longer service life, a better efficiency in the conversion of electrical energy into radiation energy in the visible spectral range and, connected therewith, a lower heat emission and a lower space requirement overall.

 EP 0 253 224 discloses a method for the manufacture of a light
20 with light-emitting diodes. The light to be manufactured comprises a soft plastic film on whose upper side a copper lamination is applied and a plurality of light-emitting diodes are arranged. The plastic film has its side lying opposite the upper side glued onto a metallic carrier plate. The light is

provided for employment in a motor vehicle, whereby the carrier plate can be implemented bent for adaptation to the shape of a motor vehicle.

Further, US 5,782,555 discloses a traffic signal light that comprises a plurality of LEDs as luminous members. The LEDs are secured on the surface of a printed circuit board that is provided with a both-sided metallization. A plurality of through holes via which the metallizations are connected to one another are formed in the printed circuit board. The printed circuit board is secured with an adhesive to a cooling member that is provided with an electrically insulating surface.

US 5,890,794 discloses another lighting unit on the basis of LEDs. Here, a plurality of radial LEDs is mounted on a printed circuit board, whereby the wire leads are conducted through the printed circuit board in a traditional way. In one illustrated embodiment, the printed circuit board is flexible and applied onto a cylindrical member. A coolant fluid is preferably employed for cooling.

A certain added outlay must be incurred first when constructing a light with LEDs since, due to the low luminance of an individual LED compared to an incandescent bulb, a plurality of LEDs shaped to form an array must be constructed.

For example, such an array can be mounted ~~{(sic) in}~~ **[using]** surface mounting technology (SMT~~{, surface mount technology} from~~**[]) with** a plurality of LEDs on a printed circuit board (PCB). ~~{An}~~ **[Such an]** LED structure ~~{as}~~ **[is]** described~~{, for example,}~~ in the article "SIEMENS SMT-TOPLED für die Oberflächenmontage" by F. Möllmer and G. Waitl in the

periodical Siemens Components 29 (1991), Number 4, page 147 ~~in~~
~~conjunction with Figure 1 is thereby employed~~. The form of the ~~{LED}~~
[LEDs] is extremely compact and allows the arrangement of a plurality of
such LEDs in a row or matrix arrangement as warranted.

5 However, only approximately 5% of the electrical power is
converted ~~{in the form of}~~ **[into]** light within the housing of such an LED that,
for example, emits yellow-colored or amber-colored light, whereas
approximately 95% is converted ~~{in the form of}~~ **[into]** heat. This heat is
eliminated from the underside of the chip via the electrical terminal of the
10 component. Dependent on the structure, the heat given the components ~~{of~~
~~the assignee known by the names TOPLED or Power TOPLED}~~ **[known as**
TOPLED® or Power TOPLED®] is first conducted ~~{out}~~ **[out]** of the housing
onto the solder points on the printed circuit board by one or three existing
cathode terminals. From the solder points, the heat at first propagates in the
15 copper pads and then on the epoxy resin material in the plane of the printed
circuit board. Subsequently, the heat is output large-area to the environment
by thermal radiation and thermal convection. The thermal resistance is still
relatively slight in the case of a single LED on FR4 circuit board material (for
example, approximately 180 K/W given an LED of the type Power TOPLED®).

20 The situation is different~~{,}~~ however, when many LEDs are
arranged in close proximity on a circuit board. A smaller percentual area of
the PCB is now available for each individual LED for ~~{the}~~ heat transmission
to the environment. The thermal resistance from the PCB onto the
environment is correspondingly higher. ~~{Given}~~ **[For instance, given]** a

components spacing off, ~~for example,~~ 6.5 mm, the thermal resistance rises to up to 550 K/W when the LEDs are of the ~~type~~ Power ~~TOPLED~~ **[TOPLED® type,]** and the printed circuit board is of the type FR4.

Heat is emitted from all heat-generating components on the circuit board, i.e. from the dropping resistors, transistors, MOSFETs[,], or drive ICs ~~as well,~~ that are located in the immediate proximity of the LEDs. ~~The~~ **[Operating]** current must be reduced so that ~~a~~ destruction of the component does not occur as a consequence of ~~the heat~~ **[heat]** generation on the circuit board and ~~the~~ inadequate heat elimination. ~~The~~ **[Thus, the]** luminous power of the LEDs ~~accordingly,~~ cannot be fully exploited.

LED arrangements are utilized for the third brake light in the aforementioned field of motor vehicle lighting. This is a single-line array wherein the thermal problems are not yet so critical.

[SUMMARY OF THE INVENTION]

It is therefore an object of the present invention to improve an LED arrangement ~~of the species initially cited~~ such that the luminous power of the LEDs can be as optimally utilized ~~as possible~~. In particular, an object of the present invention is to specify a surface-mounted LED arrangement that is distinguished by an improved heat elimination from the LEDs. In addition, an LED arrangement should be made available with which different spatial shapes of three-dimensional lamps can be realized in a simple way.

~~This object is achieved by an LED arrangement having the features of patent claim 1. Advantageous developments of the invention and~~

~~preferred lighting devices having inventive LED arrangements are the subject matter of patent claims 2 through 14.~~

According to the invention, an LED arrangement with a printed circuit board and a plurality of LEDs -- surface-mounted LEDs are especially preferred -- is
5 provided, whereby the printed circuit board has its side facing away from the LEDs applied on a cooling member and comprises a metallic layer with good thermal conductivity on this side that is electrically insulated from the LEDs by the printed circuit board. The **[present]** invention is thus based on the perception that ~~(the)~~ heat elimination toward the back must be promoted,
10 particularly given a surface-mounted LED arrangement having a high LED density.

The cooling member can ~~(, for example,)~~ be composed of copper or aluminum or of a cooling plate, and the printed circuit board is preferably secured ~~(on)~~ **[to]** it with a thermally conductive paste, a thermally conductive
15 adhesive, a thermally **[conductive film or the like. It should enable an optimally good heat dissipation at its back side. To this end, for example, it can be painted black and/or comprise cooling ribs and/or a rough surface.**

Further, the printed circuit board should be as thin as possible
20 since the plastic material of which it is constructed usually conducts heat poorly. For example, the printed circuit board can be a flexible printed circuit board. The flexible printed circuit board is generally manufactured of a flexible plastic. For example, it can be composed of polyester or polyamide film, or it may comprise what is often referred to

as flex-board. Flex board is generally multi-layer printed circuit boards that are uniformly constructed of a plurality of polyamide carrier films.

Further, the copper pads around the solder surfaces of LEDs applied with surface mounting technique (SMT) should be as large as possible in order to broaden the heat path through the printed circuit board material before the heat flows to the back side of the printed circuit board. Preferably, the principal face of the printed circuit board facing toward the cooling member is laminated with copper or some other metal in order to enable thermal conduction transversely to other glue] locations given cavities in the lamination. For example, the copper layer can be structured meander-shaped laterally to the printed circuit board in order to preserve the flexibility of the printed circuit board.

In an ~~{inventive}~~ [embodiment of the] LED arrangement [according to the present invention], a cooling member having a specific three-dimensional shape is employed, and a flexible printed circuit board ~~{that has}~~ [having] a principal face provided with a plurality of LEDs is laminated onto the surface of the cooling member shaped or curved in this way. As a result thereof, LED modules spatially shaped on the basis of specific particulars can be manufactured. ~~{An}~~ [For example, an] LED module [such] as~~(, for example,)~~ [a] blinker, tail light, brake light ~~(of)~~, or] the like[,] can be adapted to the outside contour of the vehicle in a space-saving fashion. An especially practical exemplary embodiment of this type is a rotating light wherein LED arrays on flex boards are laminated around a cylindrical cooling member.

The LED arrangement **[of the present invention]** can preferably have its printed circuit board applied on a highly thermally conductive partial surface region of a device housing or of an automobile chassis or the like.

Advantageously, the device housing or ~~{, respectively,}~~ the automobile chassis
5 ~~{or the like}~~ thereby acts as cooling member. Among other things, this leads to a lower technological manufacturing outlay and to a weight-saving.

~~{These}~~ **[Thus, the thermally conductive]** partial surface region ~~{{sic} thus represents}~~ **[serves as]** the cooling member in the ~~{sense of the present invention.}~~ **[present invention.]**

10 ~~**[Further advantageous developments and preferred embodiments are explained in greater detail below on the basis of exemplary embodiments in conjunction with Figures 1A through 2C. Shown therein are:]**~~ **[BRIEF DESCRIPTION OF THE DRAWINGS]**

~~{Figure 1A a side view of a basic}~~ **[Figure 1A shows a side view
15 of an]** embodiment of the present invention ~~{wherein the printed circuit board of a surface-mounted LED arrangement is secured to a cooling member.}[:]~~

~~{Figure 1B a schematic illustration of a possible structure of the highly}~~ **[Figure 1B shows a schematic of an embodiment of a]** thermally conductive layer **[according to the present invention]; and**

20 **[Figures 2A-2C {modified} [shows other] embodiments of the present invention with different shapes of cooling members.**

[DETAILED DESCRIPTION OF THE PRESENTLY PREFERRED EMBODIMENTS]

The embodiment of the present invention] ~~{The basic~~

~~embodiment}~~ shown in Figure 1 contains a printed circuit board 1 on which a plurality of preferably surface-mounted LEDs 2 are applied ~~{by means of~~
~~{sic}}~~. In a known way, the printed circuit board 1 thereby ~~{comprises}~~ **[forms]**

5 a circuit that comprises terminal surfaces for the mounting of the LEDs at defined locations. These terminal surfaces are provided, for example, with lands for soldering in an automatic surface mount device (SMD) equipping unit, and the LEDs 2 have their electrical contacts 2a soldered to these terminal surfaces in a subsequent mounting step.

10 The printed circuit board 1 can ~~{thereby}~~ be a rigid printed circuit board, ~~{for example of the}~~ **[such as]** type FR4, and ~~{, accordingly, is~~
~~essentially}~~ constructed of an epoxy resin material. However, it can also be a flexible printed circuit board such as an above-described flex board. The printed circuit board 1 is laminated onto a cooling member 3 with a thermally
15 conductive adhesive, said cooling member 3 being composed of a cooling plate or being fabricated of some other metal such as copper or aluminum[,]
and thus exhibiting a high thermal conductivity.

The principal face of the printed circuit board 1 facing toward the cooling member is laminated with a layer 4 having good thermal conductivity,
20 ~~{for example}~~ **[such as]** with a copper layer or some other metal layer in order to ~~{still}~~ enable thermal conduction transversely to other glue locations given cavities in the lamination. The copper layer can ~~{, for example,}~~ be meander-shaped ~~{(Figure 1B)}~~ **[as shown in Figure 1B]** in order to preserve the flexibility of the printed circuit board.

~~{That}~~ **[The]** side of the cooling member 3 facing away from the printed circuit board 1 is preferably designed such that ~~{the}~~ heat output to the environment is maximized. To this end, this surface is blackened and/or provided with cooling ribs and/or implemented with some other suitable
5 surface structure or roughening.

Figures 2A through C show how the invention can be advantageously utilized in order to manufacture specific three-dimensional lighting members. In all illustrated instances, a cooling member 3 having a desired shape is first prepared, whereby one surface should be fashioned as
10 luminous surface by applying an LED arrangement composed of surface-mounted LEDs 2. A flexible printed circuit board 1 such as a flex board that is provided with an array of LEDs 2 is then laminated onto the cooling member 3.

In a side view, ~~{for example,}~~ Figure 2A shows an arbitrary
15 curvature of a cooling member 3 that can be especially advantageously employed for an exterior vehicle illumination such as a blinker, a tail light ~~{or},~~ a brake light[,], or the like[,], since it can be adapted to the outside contour of the vehicle in a space-saving fashion. ~~{For example, the}~~ **[The]** cooling member can be directly formed by a partial surface region of an
20 automobile chassis~~{(for example,)}~~, **such as** the headlight or tail light region of the fenders[,], or a device housing ~~{or the like}~~.

The exemplary embodiment of Figure 2B shows an axial
~~{crosssection}~~ **[cross-section]** through a rotating light of a type that can, ~~{for example,}~~ be employed in emergency vehicles~~{. Given to}~~, **for example. For**

the] rotating light of Figure 2B, the flex board 1 [is] provided with an array of LEDs 2 is laminated around a tubularly shaped, cylindrical, hollow cooling member 3. In this exemplary embodiment, the LEDs of the array proceeding parallel to the axis can be additionally combined to form lanes that are

5 successively driven in a clockwise direction~~((see arrow))~~, so that a rotating light is produced. At one point in time, one lane or a specific plurality of neighboring lanes can thereby be driven simultaneously. For bundling the emitted light, ~~{moreover,}~~ the LEDs 2 can be provided with lenses 5. This embodiment has the ~~{great}~~ advantage that practically all mechanical parts

10 that have hitherto been needed for rotating lights of a conventional type are eliminated. As desired, the cylindrical cooling member 3 can also have a gas[,] such as air or a liquid coolant[,] flowing through it for further improvement of the heat elimination.

Figure 2C shows a perspective view of a three-dimensionally arced

15 light dome. The light dome comprises a regular shape with an upper surface and four obliquely placed side surfaces, two respective side surfaces thereof ~~{being}~~ [are] arranged axially symmetrically relative to one another. The cooling member itself cannot be seen in the illustration of Figure 2C since it is completely covered by the flex board. The flex board 1 comprises a plurality

20 of sectors corresponding to the surfaces of the cooling member and wherein a plurality of LEDs 2 arranged in an array are respectively mounted. ~~{As wanted, the}~~ [Th] LEDs 2 can be provided with lenses for bundling the emitted light[, as d sired]. Such a light dome can be utilized for all types of lighting purposes.

[Although modifications and changes may be suggested by those skilled in the art to which this invention pertains, it is the intention of the inventors to embody within the patent warranted hereon all changes and modifications that may reasonably and properly come

5 under the scope of their contribution to the art. - -]
